

#### **Features**

- VGA (640 x 480 pixels) resolution
- Amorphous silicon TFT LCD panel with back-lit unit
- Pixel in stripe configuration
- · Light weight and slim
- Displays 262,144 colors
- Optimum Viewing Direction: 6 o'clock
- Portrait mode
- TTL transmission interface
- RoHS compliant

Product specifications contained herein may be changed without prior notice. It is therefore advisable to contact Purdy Electronics before proceeding with the design of equipment incorporating this product.

# **AND-TFT-5VX-4HB**

# 640 x 480 Pixels LCD Color Monitor

The AND-TFT-5VX is a compact full color TFT LCD module, whose driving board is capable of converting composite video signals to the proper interface of LCD panel and is suitable for computer peripheral, industrial meter, image communication and multi media.

This device consists of an amorphous silicon panel with back-light, incorporating a TFT-array that has  $640 \times 480$  pixels on a 5 inch diagonal screen, with pixel in stripe configuration, 262,144 display colors and a TTL transmission interface.

#### **Mechanical Characteristics**

| Parameter              | Specification                | Unit |
|------------------------|------------------------------|------|
| Screen Size            | 5.0 (diagonal)               | inch |
| Display<br>Format      | 640 (H) x (R, G, B) x 480(V) | dot  |

| Starting Voltage (0°C)<br>(Reference Value)  | Vs             | _              | _    | 900  | Vrms  | Note 3              |

- Note 1: In order to satisfy the quality of B/L, no matter what inverter is used, the output lamp current must be between Min. and Max. to avoid the abnormal display image caused by B/L.
- Note 2: The waveform of lamp driving voltage should be as close to a perfect sine wave as possible.
- Note 3: The "Max of starting voltage" means the minimum voltage of inverter turns on the CCFL and it should be applied to the lamp for more than 1 second to start up. Otherwise the lamp may not be turned on.

#### **Power Consumption**

| Parameter                                 |                 | Symbol Conditions      |                          | Sı     | Remark |        |        |

| 27     | GND    | I   | Ground                                      |        |
| 28     | VCC    | I   | Voltage for logic circuit                   |        |
| 29     | GND    | I   | Ground                                      |        |
| 30     | VEE    | I   | Gate Off Voltage                            | Note 1 |

- Note 1: Gate off voltage, V<sub>EE</sub>=10V.
- Note 2 : Gate on voltage, V<sub>GG</sub>=19V. Note 3 : Select up or down shift (see Table 1)
- Note 4 : Gate driver shift clock
- Note 4: Gate driver shift clock

  Note 5: When OE is connected to high "1", the driver outposts are disabled (Gate output=V<sub>EE</sub>). Under this condition, the operation of registers will not be affected.

  Note 6: Select left or right shift (see Table 2)

  Note 7: Latch the polarity of outputs and switch the new data
- to outputs. At the rising edge (LD), latch the "POL" signal to control the polarity of the outputs.

  Note 8: Control whether the Data RO~G5 are inverted or not.
- (PVI suggests connecting to GND) When "REV=1" these data will be inverted. EX: "00" to "3F", "07" to "38", "15" to "2A"
- Note 9 : Polarity selector for dot-inversion control. Available at the rising edge of LD. When POL=1: Even outputs range from V1~V7, and Odd outputs range from V8~V14, and Odd outputs range from V1~V7.

### Table 1

| U/D | STVU  | STVD  | Shift      |
|-----|-------|-------|------------|
| 1   | Hi-Z  | Input | Down to Up |
| 0   | Input | Hi-Z  | Up to Down |

### Table 2

| R/L | DIO2  | DIO2  | Shift         |
|-----|-------|-------|---------------|
| 1   | Input | Hi-Z  | Left to Right |
| 0   | Hi-Z  | Input | Right to Left |

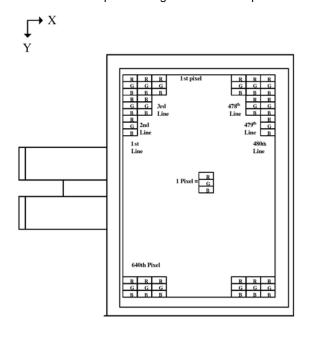

# **Interface Timing**
